## BUSINESS FOCUS: AQUATERA

### ABOUT OUR BUSINESS:

Aquatera provides environmental services and products to support its clients in a number of onshore and offshore sectors. Our main area of expertise is in renewable energy (mainly wave and tidal) but we work in various other sectors such as hydrogen, aquaculture and oil and gas. We work with various clients, including individuals, community groups, business and national government.

Aquatera's goal is to 'think locally, act globally' and promote sustainable development. Orkney is viewed as a living laboratory for the energy industry and one which we can take lessons learned from a local remote island context to apply in our projects worldwide.

### OUR CAREERS

As consultants, our roles span experience levels from junior to senior and expert consultant, within which we have dedicated project managers and members of separate teams such as the data/GIS (Geographical Information Systems) team, and the Environmental Impact Assessment team.

Through the variety of projects team members can remain generalist or carve out specialist roles based on their own technical knowledge and skills.

We also have key roles in administration and finance supporting running of the business.

### SKILLS

The key skills to being an environmental consultant are transferable from a wide range of disciplines, so it is always good to keep working on them throughout school and higher education. These include: written or verbal communication, IT skills, self-management, teamwork and problem solving.
